

LearnHub+

Project Report

Mohamad Ali Hammadi
5/31/2026

1. Project Overview

LearnHub+ is a frontend web application made with React. Its an online learning platform where users can look at courses, learn about the platform, see services and contact the team. The website works on desktop and mobile too.

2. Pages

The website has 4 pages:

Home: This is the landing page. It has a hero section with a "Browse Courses" button, a grid of 6 courses like Web Dev, Data Science, UI/UX etc, and some stats at the bottom (students enrolled, courses available etc).

About: Tells you about LearnHub+ - who they are, their mission, why you should use them (expert instructors, learn at your pace, certificates, community support) and shows the team members.

Services: Lists what they offer - online courses, certifications, live mentoring, community forum, mobile access and progress tracking. Each one has an icon and description.

Contact: Has a contact form with fields for name, email, subject and message. It validates that all fields are filled before sending. Also shows address (Beirut, Lebanon), email and phone number.

3. What I Used

- ReactJS - for building the UI
- React Router DOM - for navigating between pages
- CSS - for styling and making it responsive
- Create React App - to set up the project
- Node.js and npm - for running and managing packages

4. Features

- Single page app so navigation is smooth
- Works on phone, tablet and desktop
- Uses React hooks like useState for state
- Contact form checks if all fields are filled
- Reusable components like Navbar and Footer
- Clean design with consistent look

5. How to Run It

First make sure Node.js is installed.

Steps:

- Download or clone the project
- Open terminal in the project folder
- Run "npm install" to install dependencies
- Run "npm start" to start the dev server
- Open <http://localhost:3000> in your browser

6. Deployment

The project is on GitHub at:

<https://github.com/Xmhmdali/learnhubplus>

It is also deployed on Vercel and can be accessed at:

<https://learnhubplus.vercel.app>

7. Conclusion

I think this project shows my understanding of React and frontend development. It has routing, multiple pages, responsive design, form handling and component based structure. In the future I could add a backend, login system, real course data and payment if needed.
