

LearnHub+

Frontend Web Application

Project Report

Prepared by: Mohamad Ali Hammadi

Date: 5/31/2026

1. Project Overview

LearnHub+ is a modern, responsive frontend web application built with ReactJS. It serves as an online learning platform that allows users to browse courses, learn about the platform, explore available services, and contact the team. The application is designed to be fully responsive and works seamlessly across desktop and mobile devices.

2. Pages

The application consists of four main pages:

2.1 Home Page

The landing page features a hero section with a call-to-action button, a course grid displaying six popular courses across different categories (Web Development, Data Science, UI/UX Design, Mobile Development, Cybersecurity, Cloud Computing), and a statistics bar showing key metrics such as student enrollment count, available courses, expert instructors, and satisfaction rate.

2.2 About Page

The About page provides information about the platform, including who we are, our mission, reasons to choose LearnHub+ (expert instructors, learn at your pace, certificates, community support), and a team section showcasing key team members.

2.3 Services Page

The Services page lists all services offered by the platform, including online courses, certifications, live mentoring, community forum, mobile access, and progress tracking. Each service is displayed in a card layout with an icon, title, and description.

2.4 Contact Page

The Contact page includes a contact form with input validation for name, email, subject, and message fields. It also displays the company contact information including address (Beirut, Lebanon), email, and phone number.

3. Technologies Used

- ReactJS - JavaScript library for building user interfaces
- React Router DOM - Client-side routing for single page applications
- CSS - Styling and responsive design
- Create React App - Project bootstrapping and build tooling
- Node.js and npm - Development environment and package management

4. Key Features

- Single Page Application with smooth client-side navigation

- Fully responsive design that works on desktop, tablet, and mobile
- React state management using hooks (useState)
- Form validation on the Contact page
- Modular component architecture with reusable Navbar and Footer
- Clean, modern UI with consistent design language

5. Setup and Running

Prerequisites: Node.js installed on the system.

Steps:

- Download or clone the project folder
- Open a terminal in the project directory
- Run "npm install" to install all dependencies
- Run "npm start" to start the development server
- Open <http://localhost:3000> in a browser

6. Deployment

The application has been deployed using two methods:

6.1 GitHub

The entire project source code is hosted on GitHub at the repository:

<https://github.com/Xmhmdali/learnhubplus>

6.2 Vercel

The production build of the application has been deployed on Vercel for live hosting. Vercel provides seamless deployment with automatic HTTPS, global CDN, and easy rollbacks.

7. Conclusion

LearnHub+ demonstrates a solid understanding of modern frontend development principles using ReactJS. The application showcases component-based architecture, client-side routing, state management, responsive design, and form handling. This project serves as a foundation that can be extended with backend integration, user authentication, a real course catalog, and payment processing in future iterations.
